Corporate

Havalandırma Grup has been maintaining its service and quality standards at the maximum level for 15 years. Passenger in the industry, We offer the opportunity to find every product sought quickly and easily with our rich product range.

Havalandırma Grup started in 2007 in Ankara with the sale of Ventilation and Air Ducts accessories and this. It has developed steadily until today.

Havalandırma Grup, Operating space first started by selling Air Channel Accessories and Air Channel Equipment. Following an expanding customer portfolio, the group expanded its workspace in 2012 with products such as Ventilation Devices, Ventilation Systems, Elastomeric Rubber Isolation and Isolation Materials, Flexible Air Channels, Geographic Air Channels, Prismatic Air Channels, Air Grills, Air Dampers, Air Louvers, Anemostad, etc. It has also contributed to the country's national income by selling out of Ankara, as well as in Russia, Azerbaijan, Iraq, Kazakhstan, Kuwait, Uzbekistan, with the growth of its customer portfolio.

Our company has always kept the understanding of "Service and Quality First" in the foreground. Increasing product quality, capacity. The targets of raising the technology have brought along the technological investments and Ventilation Devices and Air Duct Accessories in 2013 as a result of the rapidly growing construction activities in the country. In the same years, the first companies that come to mind in the sector are Isidem, Blauberg Fan, Aksa MotorFan. It has increased its product and brand range by making agreements with companies.

Havalandırma Group is today in the field of supplying materials in all kinds of Mechanical Installation and ventilation sectors. provides services and can respond to all kinds of special orders and special projects.

Our company is located in Ankara with its expert staff, 1000 square meters of sales area and 3000 square meters of warehouse areas. It continues its activities in İvedik Organize Sanayi Bölgesi.

Our Quality Policy

By evaluating the technology and living conditions required by our age in the best way and providing customer satisfaction to bring our company to a reliable, stable and sector-leading position in Ankara and Turkey. In the direction of the development of our employees and all the technological equipment we use, at the maximum level to invest. Internationally accepted ISO 9001 quality system, CE-TSE, Domestic Production Certificate and while increasing our service quality by applying quality standards to our management with Domestic Goods certificates, in an endless harmony with our customers with our technical consultancy and after-sales services. work. To be in constant cooperation with the supplier companies in mutual trust. Human the determination to work, motivation development and belonging by making the best use of the resources provide the feeling. The service provided is subject to international standards related to the law, the customer ensure compliance with their expectations and needs.

Evaluating all activities as a process, planning, implementing and control and continuously improve its performance. Competitive in world markets Contributing to the Turkish economy by using our structure

Havalandırma
Grup

AIR CHANGE PER HOUR CALCULATION

HOURLY AIR CHANGE NUMBER METHOD

It removes the volume (width x length x height) of the place to be ventilated. According to the purpose of use, the air change per hour (Table: 1) is multiplied by air and the ventilation flow for that place is found. Accordingly, the air requirement;

$$Q = H_d V_m \text{ (m}^3/\text{h)}$$

H_d : Number of Air Changes (times/hour = 1/h = h⁻¹) (Table:1)

V_m : Total Volume of the Environment (m³)

Hourly Air Changes of Different Places

Table-1

PLACES NAME	AİR CHANGES NUMBER	PLACES NAME	AİR CHANGES NUMBER

FIRE SMOKE EVACUATION CALCULATION

JETFAN SMOKE EVACUATION SYSTEM

In multi-storey car parks, the capacity calculation should be made by assuming that the fire will occur on the floor with the largest volume.

Smoke evacuation capacity;

“10 air changes/hour”

or

“heat and smoke control system”

how it is calculated.

SYSTEM WITH AIR CHANGE

According to the Turkish Fire Protection Regulation, it is obligatory to discharge smoke according to at least 10 air changes in parking garages larger than 2000 m².

With the 10 air exchange method, the smoke is diluted, but it covers the entire fire area. It is preferred that the fire area does not exceed 5000 m². Each fire zone must have at least one smoke evacuation chimney.

According to BS 7346-7 :

This system does not aim to protect any area from smoke in the parking lot. It aims to dilute the smoke, reduce its temperature and assist escape.

HEAT-SMOKE CONTROL SYSTEM

Accordin to BS 7346-7 :

The fire zone should be at most 2000 m². The smoke is not allowed to go out of the area. The fire brigade should be able to approach the fire point up to 10m from the fresh air direction.

It should be seen in the CFD study that the smoke does not pass to other regions.

In order for the smoke to be kept in an area of 2000 m², the air velocity in the section should be 0.5 - 1.0 m/s without the effect of the jet fan.

For fire zone 40 m width, 50 m depth and 3 m height:

$$40\text{m} \times 3\text{m} \times 0,5\text{m/s} = 60\text{m}^3/\text{s} (216.000 \text{ m}^3/\text{h})$$

$$40\text{m} \times 50\text{m} \times 3\text{m} \times 10 \text{ Change} = 60.000\text{m}^3/\text{h}$$

FIRE SMOKE EVACUATION CALCULATION

$$V = (M(T_s + 273) / r(T_o + 273)) \times 3600$$

V: Smoke Volume (m^3/h) T_s :Smoke Temperature at Fire Point ($^{\circ}C$)
 To: Ambient Temperature ($^{\circ}C$) r: Density of air ($1,2 \text{ kg/m}^3 @ 20^{\circ}C$)

$$M = 0,19 \times P \times Y \times 1,5$$

M: Smoke Mass (kg/s) P: Around the Fire (m)

Y: Height of smoke layer from ground

$$T_s = (Q/M) + T_o$$

Q : Fire Thermal Load (kW/m^2)

Fire Data	With Sprinklers In the Parking	Without Sprinklers In the Parking
Fire Thermal Load	2m x 5m	5m x 5m
Ambient Temperature	14 m	20 m
Around the Fire	4 MW	8 MW

Q	Fire Thermal Load	4	MW
T _a	Ambient temperature	20	$^{\circ}C$
P	Around the Fire	14	m
y	Smoke Layer Height	1,8	m
M	Smoke Mass	6,42	kg/s
T _s	Smoke Temperature	643	$^{\circ}C$
V	Smoke Volume	60,129	m^3/h

SITE DESIGN CRITERIA

According to BS 7346-7 :

Smoke evacuation chimney of each fire zone should be separate. Air velocity should not exceed

5m/s on escape routes and ramps.

The air velocity at the fresh air entry points

should not exceed 2m/s to avoid smoke circulation .

The amount of air activated by the Jet Fans should be higher than the amount of exhausted air. As soon as the fire signal comes, the main fans should be activated at full capacity, the jet fans should be activated with a delay to allow escape.

The amount of fresh air intake must be ensured. (70% of the exhaust amount)

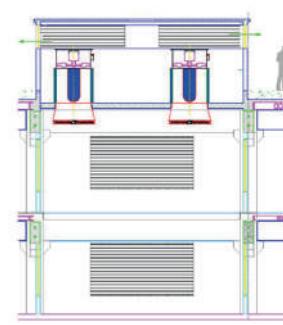

The Fire Zone must remain at negative pressure.

The exhaust direction should be determined by considering the escape points.

It should be ensured that the sprinkler heads are not close to the jet fan nozzles.

In multi-storey car parks, there should be motorized dampers at the shaft entrances.

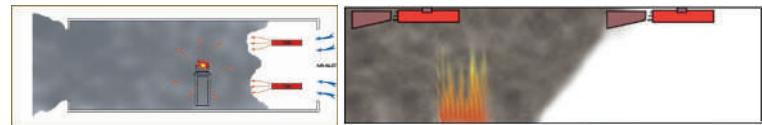

There should be a motorized damper on the fan to prevent air escape from the non-operating fan.

JETFAN's are named according to their propulsion;

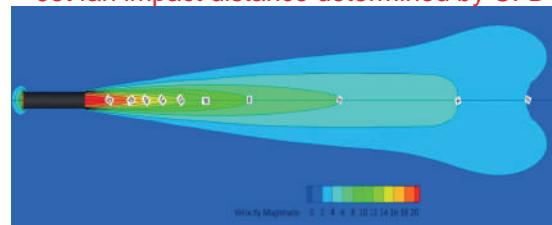

$$\text{Impulse Force(N)} : V \times Q \times \rho$$

V: Air Velocity (m/s)
 Q: Air Flow Rate (m^3/s)
 ρ : Air Density (kg/m^3)

Impulse force	Parallel Distance	Series Distance
30 N	8-10 m	15 - 20 m
50 N	15 m	35 - 40 m
80 N	15 m	55 - 60 m
100 N	15 - 17 m	70 - 80 m

Jet fan impact distance determined by CFD

SHELTER VENTILATION CALCULATE

SHELTER VENTILATION

Ventilation Regardless of the type of shelter, mechanical ventilation is mandatory

Duty of Ventilation Installation

It is the sending of sufficient and clean air to the shelter under suitable conditions for people who have to shelter with room conditions for protection.

Ambient conditions

By providing adequate air exchange To prevent the entry of radiated, biological and chemical dusts and particles;

O₂ Level > %19

$$P_i - P_d = \Delta p = 50 \text{ Pa}$$

CO₂ Level < %2

it should be.

The pressure difference must be maintained.

Cleaning of Shelter Air The Ventilation System

The ventilation system should be arranged in a way to protect and operate in normal condition.

The outside air in normal condition is only taken inside by passing through the G4 coarse filter.

In Protection Times

Air taken from outside; G4 is passed through a filtering system such as a coarse, nuclear type hepa, activated carbon filter or sandbox and given to the shelter.

Air is not heated/cooled/humidified during protection times.

The first position of the protection position is the closed position to the outside atmosphere, and the air inside the shelter is circulated, filtered and reintroduced after cleaning.

The second position of the protection state is the situation where the outside air can be filtered and cleaned, and the minimum amount of air is taken from the outside.

The air cleaned in NBC Filters is mixed with the circulating air and given into the shelter. The filtration system creates positive pressure inside the shelter, preventing toxic agents from entering.

If the risk of fire is high in the area where the shelter is located, the sandbox system must be used first.

During the protection times for the ventilation of the shelter, the air flow rates required for one person are taken.

Flow capacity values are minimum values and any additional measures to increase air quality can be used in the design.

Shelter Capacity	Protection Ventilation	High Fire Hazard	LOW AND MEDIUM FIRE HAZARD
0-50 Up to Person	1.8 m ³ /h - Person	Sand Filter, G4 Dust Filter, Active Carbon Filter	G4 Dust Filter, Radioactive Filter and Active Carbon Filter
51-150 Up to Person	3m ³ /h - Person	Sand Filter, G4 Dust Filter, Active Carbon Filter	G4 Dust Filter, Radioactive Filter and Active Carbon Filter
150 More than People	4.5 m ³ /h - Person	Sand Filter, G4 Dust Filter, Active Carbon Filter	G4 Dust Filter, Radioactive Filter and Active Carbon Filter

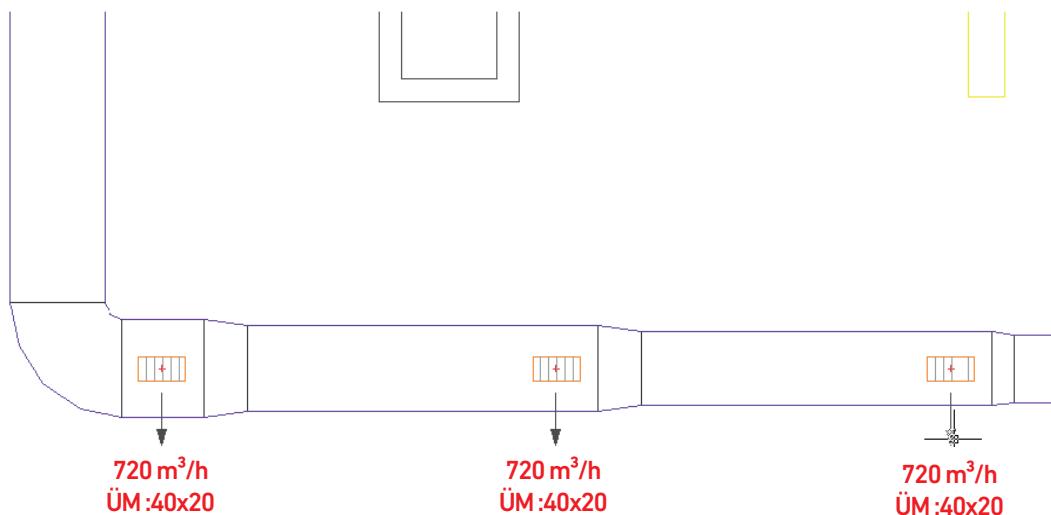

SHELTER VENTILATION CALCULATE

The duct design, the number of culverts and their placement are arranged by the mechanical installation project designer.

This regulation TS3419 "Ventilation and Air Conditioning Facilities-Design Rules" and
 TS3420 "Air Conditioning and Air Conditioning Facilities Placement Rules"
 It is made taking into account the standards.

Air Distribution

Supply and outlet openings should be placed in accordance with the geometric shape of the volume desired to be ventilated, in a way that the supply air will sweep all the air, provide a breeze-free and effective ventilation in the volume, and will not disrupt the architecture of the building. Therefore, vertical surfaces close to the ceiling or ceiling, wall should be preferred.

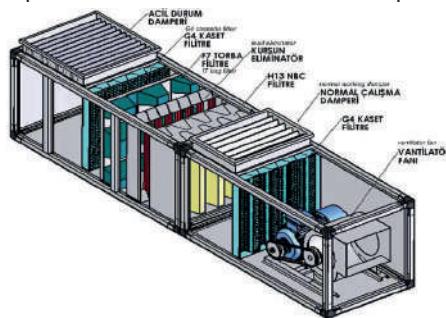

Duct Material Properties

Ventilation ducts installed for mechanical ventilation must be made of steel, aluminum and similar materials
 Ducts to be used in all mechanical ventilation systems must be connected with sufficient number of suspension elements.
 The duct lining material must be at least of hardly flammable material

Plant Material Properties

Panels must be double-walled aluminum, steel or galvanized
 In order to be protected from the harmful effects of (X) rays, the inside of the cell should be covered with 1.2 mm lead plate.
 Fresh air must pass through the lead eliminator.
 Cells must be extremely rigid and impermeable.
 Fans that produce high pressure should be preferred in order to overcome the pressure inside the device and transfer the air.
