

# \*NETGSM COMMUNICATION AND INFORMATION TECHNOLOGIES INC.\*

Our company, Netgsm, together with its group companies Teknotolya A.Ş. and Akontel Ltd., operates in the Electronics, Telecommunications, and Software sectors.

Generally, we develop R&D-based infrastructure and end-user products in software and electronics, and establish and operate value-added service systems for end-users using developing Internet and Artificial Intelligence technologies.

In this context, we need to sell the products and systems we develop, produce, and install abroad.

Furthermore, we need to collaborate with

or jointly produce software and electronic products with companies providing similar services abroad.

In particular, the electronic circuits we develop for access control systems are compatible with current technology and work integrated with various software.

Moreover, the integration of our devices with similar software used globally, or similar devices produced in other countries with the software we develop, is extremely important for the global expansion of our products.

In this context, it is important for us to meet and cooperate closely with similar software and electronic device manufacturers abroad.

Internet of Things (IoT) systems, which are expected to become widespread in the near future, especially in the communications sector, have a wide range within this scope.

Furthermore, as an R&D center, we need to cooperate with foreign companies that produce similar mobile core network software, in order to globalize the applications of these systems.

Our company has sold access control devices to numerous customers nationwide and has established access control systems with software compatible with these devices.

With its virtual telephone exchange software, which operates over the Internet and has an integrated communication

infrastructure, it has nearly 10,000 corporate customers. The necessary knowledge, experience, and maturation processes for the global launch of this product have been completed.

Therefore, our Virtual PBX product is ready for international sales, and its installation abroad is possible thanks to its multilingual feature.

Our company ranked 173rd in Türkiye in terms of R&D spending in 2024, among approximately 1,500 R&D centers in the country.

With our experienced engineering team and mature products, expanding abroad is of paramount importance.
